

ABSTRACT

1 A method and corresponding system for adapting memory-resident database in
2 flexible service logic execution environment (FSLEE) provides certain features to be
3 incorporated with FSLEE. FSLEE is a framework that supports services, such as
4 processing logic services and telephony services. The method implements FSLEE
5 support for memory based database environments (MBEs), and stores data in a resident
6 memory for the services to improve database access speed.
